Unit 3 : Session 10 : SLO 1 | Use Java Swing Widgets for GUI Creation

I. Fill in the Blanks

1. JButton is the Swing class used to create a push button.
2. ButtonGroup groups radio buttons so that only one can be selected at a time.
3. JTextArea displays multiple lines of editable text.
4. HIDE_ON_CLOSE is setDefaultCloseOperation(JFrame.HIDE_ON_CLOSE) hides the frame when it is closed.

II. True or False

1. FALSE is True. JTextField accepts a single line of text; selecting from a list is done with JComboBox or JList.
2. FALSE is True. a JComboBox is not editable by default; setEditable(true) is required to allow free typing.

III. Multiple Choice

1. B is True. JLabel displays a non-editable line of text.
2. C is True. JRadioButton (inside a ButtonGroup) allows exactly one choice among mutually exclusive options.

IV. Programming

1. Identify the output: B is True. a window titled "Test" appears showing the label text "Welcome".
2. Find the error: C is True. neither setSize() nor pack() is called, so the frame would open with zero/default size; call f.setSize(...) or f.pack() before setVisible(true).
