Unit 2 : Session 1 : SLO 1 | Fundamentals of Arrays and Their Operations

I. Fill in the Blanks

- contiguous array elements are stored in contiguous memory locations.
- 0 the first index is usually 0 (in C).
- arr[4] the 5th element is at index 4.
- append adding at the end of a dynamic array.
- searching finding the position of an element.
- shifting middle insertion requires shifting elements right.
- data type arrays are declared as: type name[size];
- two-dimensional (2D) used to represent matrices.
- same all elements share one data type.
- size (capacity/length) how many elements it can hold.
- single-dimensional (one-dimensional).
- deletion removing an element from a position.
- integer (non-negative integer) indices must be integers.
- fixed size is fixed once declared in C.
- for the for loop is the common traversal loop.
