Unit 3 : Session 11 : SLO 1 | Integrate Event Handling in GUI Applications

I. Fill in the Blanks

1. ActionListener is the interface used to handle button clicks in Swing.
2. addActionListener is btn.addActionListener(listener) registers the listener.
3. getActionCommand() returns the action command string from an ActionEvent.
4. java.awt.event is the ActionEvent class lives in the java.awt.event package.

II. True or False

1. TRUE is Swing dispatches events synchronously on the Event Dispatch Thread (EDT), so long tasks should be moved off it.
2. TRUE is one ActionListener instance can be registered with any number of buttons (distinguished via getActionCommand()).

III. Multiple Choice

1. B is actionPerformed(ActionEvent e) is the single method of the ActionListener interface.
2. B is an ActionEvent object is passed to actionPerformed().

IV. Programming

1. Output: C is clicking the button fires the lambda listener and prints "Hello".
2. Event-driven part: B is the anonymous ActionListener (its actionPerformed method) is the event-driven part of the snippet.
